Abstract

Objectives Evolutionary medicine is a growing field focusing on the evolutionary basis of human diseases and their changes through time. The introduction of concepts of long- and short-term evolution into the medical curricula is essential to acknowledge the variability of human biology.

Methods Three courses of the EM taught at the University of Zurich and the University of Adelaide are presented by giving their general descriptions, full curricula, and the results of anonymized student evaluations.

Results The presented courses meet a growing need and were positively received by the students. Most importantly, they seem to stimulate critical thinking about issues relating to health and evolution.

Conclusions The incorporation of these topics into curricula will allow future practitioners of health-related professions to apply principles of human evolution and its forces in their work.

Keywords Disease · Curricula · Evolutionary medicine · Medical school

Introduction and Rationale

Humans are not only the product of a long evolutionary process but are also continuously evolving [1, 2]. We therefore

show variation of anatomical structures and physiological processes, as well as disease patterns and prevalences (Fig. 1). Intergenerational changes of human anatomy and pathology have been frequently reported and are of foremost interest (e.g., for surgeons). Significant changes in morphological characteristics include the following: decrease in the robusticity of the musculoskeletal apparatus (gracilization) [3–5], weight and height [6], microcranialization and brachycephalization (reduction in braincase size and change of its shape) [7–9], reductions in the size and number of teeth [10], spinal morphology alterations [11, 12], changing frequencies of tarsal coalitions [13], increase of the frequency of some arteries (median) [14], and decrease of others (thyroidea ima) [15]. These alterations are all likely to be at least partially the result of structural reductions in response to technology diminishing the need for the use of physical strength. Aside from genetic changes, they therefore may also occur from epigenetic alterations due to differing environmental pressures such as a reduction of chewing effort in the processing of food, leading to reduction in jaw size [16, 17]. Moreover, the ubiquitous low-back problems of modern humans, shoulder impingement, hip and knee osteoarthritis, and other musculoskeletal diseases are often attributed to anatomical variants inherited from our early hominin ancestors as trade-offs to the evolution of bipedal locomotion [18–25]. However, the degree of variability of human morphology is often neglected in traditional medical curricula. These facts require the introduction of concepts of long- and short-term evolution into medical curricula.

Evolutionary Medicine Curricula

The call for the incorporation of evolutionary topics into the modern biomedical curriculum has been raised for

Fig. 1 Interactions of humans, environment, and medical technology as addressed by evolutionary medicine

more than 10 years [26]. However, no specific large, medically oriented evolutionary medicine (EM) research unit existed until 2010 [27–29]. Since then, the number of top universities offering EM-related teaching is steadily increasing [27, 29]. Thus, the full biomedical academic potential of EM is still largely untapped, especially when it comes to evidence-based applications. In terms of practicality, the inclusion of a so-called clinical anatomy skills lab into an EM research center—where clinicians train and experiment, e.g., on human morphological variability in close collaboration with anatomists in the dissection room—may provide an appropriate launching place for EM studies on such human morphological microevolution.

A plethora of EM-related topics to be taught in medical schools could be named (Table 1). These combine, e.g., themes of clinical medicine, basic research such as genetics, human biology, physical and social anthropology, and archeology. The benefit of such evolutionary-based academic education has been laid out recently by a consensus paper, which highlighted the rationale for such teaching, the learning objectives for both—premedical and medical competencies—as well as the general integrative power of EM teaching [30]. Furthermore, it is apparently feasible to acquire third party funding for this particular field of research [29], thus combining graduate and postgraduate teaching and research of EM within state-of-the-art academic facilities (such as the abovementioned clinical anatomy skills lab). On a larger

Table 1 Selection of lecture and seminar topics from our courses of evolutionary medicine

Titles of lectures and seminars

- Adaptive explanations of reaction to infectious diseases.
- Host and parasite co-evolution, evolutionary history of major chronic infections: treponematoses, leprosy, tuberculosis
- Demographic future of humankind, demographic modeling
- The role of disease in society, perceptions of health in diverse cultures
- Future medical developments: nanotechnology, genetic engineering, recombinant DNA
- Cultural roles of children, adolescents, adults and elderly—how they impact on health. Human senescence, the aging society of the future
- Psychological health in various stages of life. Impact of disease on human individual relations
- Perception of psychiatric ailments in various cultures
- Modern maladaptations—drugs and other addictive agents; socioeconomic mental health inequalities
- Human dietary adaptations (“natural” human diet), mismatch with modern nutrition
- Cross-cultural nutritional practices, food taboos, malnutrition, obesity
- The role of sexual relationships in nondirectional forces of evolution: inbreeding and incest avoidance. Assortative mating and its consequences. Cultural differences
- Feminine approaches to the body and health
- Masculine body image, men’s health
- Sexual disease, social structure and public health
- Adaptive responses of human body, short-term adaptive trends (micro-evolution, secular trends)
- The future of humankind (discussion)
- Ethics in future medical practice and public health

scale, this could result in worldwide collaborations and implementation in leading health science schools around the globe.

The Modules: Aims and Outline

Here, we present three novel courses held between autumn 2012 and spring 2015 that embed the teaching of secular trends in the human body and pathology: (1) a full semester undergraduate course on evolution and health introduced in 2012 at the University of Adelaide as an elective for medical students, and a senior (level III) course for health sciences students; (2) an intensive master-level postgraduate “block course” for science students introduced at the University of Zurich in 2013, the first tertiary level full course in evolutionary medicine to be taught in Switzerland; and (3) an elective course for medical undergraduate students introduced in 2014 at the University of Zurich.

Based on our own original data of temporal changes in human body structures—e.g., the prevalence of additional arteries or of spina bifida occulta, and palaeopathological

observations—such topics are addressed both in a classical lecture format and in interactive practicals and seminars co-run by students.

The first module at the University of Adelaide has a maximum of 50 students quota and consists of 4 h of contact per week for 12 weeks. However, students are expected to spend about at least another 4 h per week on researching for their written tasks that comprise the assessment. In the past, some students have reported spending more than this amount of time on research and reading and writing. Thus, 4 h would be the minimum time required. The course is offered every year and comprises lectures, seminars, discussion, and self-directed learning activities. Selected course learning objectives are listed in Table 2.

The second module, the block course at the University of Zurich, is available to graduates of the 3-year degree (license = BSc) who are registered for a Master of Biology degree. It is limited to 20 students only to provide an opportunity for small group work and development of individual interests. It is run over 4 weeks (3.5 days per week) and consists of 34 h of lectures and 39 h of seminars as well as practicals in osteology, bone pathology, imaging techniques, ancient DNA analysis, and analysis of large health-related datasets. The main objectives of the block course are listed in Table 3.

The third module is available to medical undergraduate and first year medical Master students of the University of Zurich (i.e., second to fourth year medical students). During these three years, the students have to choose 6 different modules among about 35 modules offered in total. The module in

Table 2 Course learning objectives Adelaide

1.	Understanding of forces of evolution
2.	How technology influences human evolution
3.	Future consequences of modern medical practices
4.	Microevolutionary changes of human anatomy and physiology in the last few thousand years
5.	Impact of migration, marriage customs, and morality on forces of evolution (inbreeding, genetic load, gene flow)
6.	Relationship between current medical practice and forces of evolution (mortality, fertility, mutations)
7.	Ethical issues of evolutionary medicine (avoidance of eugenic errors)
8.	Socioeconomic conditions and physical development of children
9.	Appreciation of cultural differences in health outcomes
10.	Ability to analyze health of communities in evolutionary perspective
11.	Ability to prepare a seminar presentation on a specific topic
12.	Ability to engage in a meaningful, structured discussion of a specific topic

Table 3 Selected course learning objectives Zurich

1.	To explain the forces of evolution and their impact on humans
2.	To formulate how evolution of pathogens, technology and environment influences human health
3.	To discuss microevolutionary changes of human anatomy and physiology in the last few centuries
4.	To examine the macroevolutionary origin of musculoskeletal disorders as possible trade-offs to the evolution of bipedal locomotion
5.	To summarize state-of-the-art research on ancient DNA (for example, next-generation sequencing)
6.	To address ethical issues of evolutionary medicine (use of ancient remains, etc.)
7.	To appreciate the impact of the concept of evolutionary medicine on biomedical science and general society

evolutionary medicine consists of 7 half days (4 h each) and is offered every semester, with a maximum of 15 students. The structure of the course and the learning objectives are similar to those of the block course, although the seminars and practicals are less extensive.

Common to all three courses is that they require student-directed learning. That is, students must take responsibility in shaping the focus of their work and in formulating arguments within that work. Lectures and seminars, both with interactive discussion, are principal learning and teaching modes. Since the courses attempt to integrate knowledge of a number of disciplines, active student participation in lectures and seminars is required. Lectures integrate knowledge already possessed by students with new approaches to its interpretation as well as to supplement knowledge where it is found to be missing. Seminars are fully interactive discussions focusing on specific topics, but allowing branching out into topics identified as important during discussions.

Each student has to prepare an oral presentation to start a seminar discussion. In addition, in the Adelaide course, each student has to write an essay on the topic chosen jointly by a student and a course coordinator so that student interests are provided for while the topic fits into the broader scope of course knowledge. The Adelaide course has a strong focus on formative feedback.

All three courses are *interdisciplinary* and comprise materials delivered by lecturers from different disciplines, and also, the classes include students from different background. The courses encourage students to think, debate, and challenge taken-for-granted ideas about health care.

Assessment of the Courses

Assessment of the Adelaide course is based on the following five principles: (1) assessment must encourage and reinforce

learning; (2) assessment must measure achievement of the stated learning objectives; (3) assessment must enable robust and fair judgments about student performance; (4) assessment practices must be fair and equitable to students and give them the opportunity to demonstrate what they have learned; and (5) assessment must maintain academic standards. An assessment summary is provided in Table 4.

The block course at the University of Zurich (i.e., second module) is assessed exclusively by a final exam as this is viewed as the most objective assessment method that is best verifiable and resistant against appeals. The third module aimed at medical undergraduate students of the University of Zurich is not given marks. To pass, the students have to give an oral presentation, attend the full course, and participate actively.

At the end of the courses, the students were asked to anonymously review the course. Survey questions are listed in Tables 5 and 6 for the courses at the University of Adelaide and Zurich, respectively.

Results

Participation in the anonymous survey at the University of Adelaide was 11 of 17 enrolled students in the 2012 course, 13 of 19 in 2013, and 13 of 20 in 2014. Over the last 2 years, 82 % of the University of Adelaide students assessed the overall quality of the course on a seven-score scale as very good to excellent (Table 5). Specifically, they assessed that the course uses appropriate strategies to engage them in their learning (mean 6.3 out of 7 points), and it helps them to develop their thinking skills (mean 6.3 out of 7 points). Students' comments on what are the best aspects of the undergraduate Adelaide course are as follows:

- Learning new ideas and things from a new perspective.
- Content in itself was extremely rewarding.
- Broad range of topics, which is very interesting.
- Covers all issues of evolution and stimulates students' critical thinking.
- It is a new course and covers areas of science that have been mentioned in other subjects but in a different way of thinking about them.

Table 4 Assessment summary of the Adelaide course

Assessment task	Type of assessment task	Weighting (%)	Learning course objectives being addressed (cf. Table 2)
Oral presentation	Formative and summative	10 %	1, 5, 10
Mid-term test	Summative	20 %	1, 2, 3, 4, 8
Essay	Formative and summative	30 %	All (1–12)
Active participation in seminars	Formative and summative	10 %	All (1–12)
Final examination	Summative	30 %	1–10

Table 5 Survey questions at the University of Adelaide course

- Q1. This course has clearly identified learning outcomes. (5)
 Q2. This course is well organized. (6)
 Q3. This course has a workload that is appropriate for the achievement of its learning outcomes. (6)
 Q4. Appropriate strategies to engage me in my learning. (7)
 Q5. This course uses appropriate online resources and technologies to help me achieve its learning outcomes. (6)
 Q6. This course uses methods of assessment that help me achieve its learning outcomes. (6)
 Q7. This course helps me to develop my thinking skills (e.g., problem solving, critical analysis). (6)
 Q8. This course has a learning environment that takes into account student diversity. (7)
 Q9. My learning in this course is supported by effective feedback. (6)
 Q10. Overall, I am satisfied with the quality of this course. (7)
 Free-answer questions:
 Q11. What are the best aspects of this course, and why?
 Q12. This course could be changed in the following ways to improve my learning

Each question has seven possible answers from 1 = strongly disagree to 7 = strongly agree. Median responses in brackets

- It encourages thinking widely about issues relating to health and evolution.

The overall return rate of the anonymous survey of the block course for biology students at the University of Zurich was 98 %. The students assessed the overall quality of the course on a five-score scale as follows: 57 % of students in 2013 and 26 % in 2014 stated that they are very satisfied, whereas the remainder (43 and 68 %, respectively) stated that they were satisfied (with only one student in 2014 (5 %) being neutral and none unsatisfied). In the module for University of Zurich medical students, the participation rate in the survey was 90 %. The high degree of overall satisfaction with the course was similar to that of the biology students at the University of Zurich (29 and 62 % were very satisfied in 2014 and 2015, respectively, and 64 and 38 %, respectively, were satisfied, with one of the 2014 students (7 %) being

Table 6 Survey questions at the University of Zurich courses

Q1	The number of students in this course is (just right)
Q2	The amount of material covered is (just right)
Q3	The level of difficulty is (just right)
Q4	The learning outcomes of the course are clear and understandable (4.2)
Q5	The course is well organized regarding information, communication, execution (4.5)
Q6	The contents are presented in a logical order (3.9)
Q7	There is a good ratio between the theoretical and practical parts of the course (3.2)
The teacher... (if you wish to add notes for specific teachers please use the back of this sheet)	
Q8	... sets up a pleasant working atmosphere (4.5)
Q9	... encourages me to think for myself (4.3)
Q10	... knows his subject well (4.9)
Q11	... is friendly and approachable for students (4.8)
Q12	... is able to interest me in the subject (4.3)
Q13	... explains complex issues clearly (4.2)
Q14	... makes connections between theory, practice and application (4.6)
Q15	... teaches in a lively and motivating way (4.4)
Q16	... structures the contents clearly (4.0)
Q17	... encourages questions and active participation (4.3)
Interest, learning, self-activity	
Q18	I have enough background knowledge to follow the course (3.6)
Q19	I participate actively in this course with questions and contributions to the discussions (3.6)
Q20	I learn a lot in this course (4.2)
Q21	My ability to analyze scientific literature has been (further) developed during this course (8 yes, 3 no)
Q22	My problem-solving abilities have been (further) developed during this course (10 yes, 2 no)
Q23	I have personally achieved the defined learning outcomes (3.9)
Overall rating	
Q24	How satisfied are you with the course as a whole? (4.6)
Q25	How satisfied are you with the teachers? (4.7)
Free-answer questions:	
Q26	How satisfied were you with the individual topics?
Q26	What was good, what would you change?
Q28	Which of the practical works did you like/dislike, and why?
Q29	What do especially like about this course?
Q30	What do you not like so much? Please make suggestions for improvement.

Each question has five possible answers from 1 = strongly disagree to 5 = strongly agree. Median responses in brackets for spring semester 2015 (module 3)

neutral). Comments on what are the best aspects of the post-graduate Zurich course are as follows:

- The insights of the development and the epidemics of disease are very helpful for biologists.
- Covers a wide range of research fields such as medicine, genetics, anthropology, and even history and ethics, which makes it very diverse and interesting.
- Small group work with specialists. Lots of teachers giving new perspectives.
- Good practicals giving access to actual specimens of bone pathologies and ancient DNA analysis.
- The course stimulates critical thinking.

Discussion and Outlook

The presented courses obviously meet a growing need, and they were positively received by the students. The format of the courses seems to be appropriate yet minor organizational and content changes based on actual evaluation may also happen in the future. Most importantly, the actual courses seem to stimulate critical thinking about issues relating to health and evolution. Another significant outcome measure is the direct involvement of students into full research activities, which already resulted in various publications [31–36]. Last but not least, the courses lead to a growing number of Bachelor, Master, and PhD students at the involved institutes.

More universally, the benefit of evolutionary-based academic education has been laid out only recently by a consensus paper, which highlighted the rationale for such teaching, the learning objectives for both—premedical and medical competencies—as well as the general integrative power of EM teaching [30]. The incorporation of principles of human evolution and its forces for future medical practitioners is thus needed, since an understanding of the evolutionary dynamics of the human body will be able to optimize medical therapies and public health policies. Presently, the number of universities offering EM related teaching is steadily increasing [27, 29]. The courses offered in EM at the Universities of Zurich and Adelaide are well received by students. A plethora of intergenerational change-related topics to be taught in medical schools could be named by the students (see above). They could combine elements of clinical medicine, public health, medical basic science research, human biology, physical and social anthropology, economic history, and even archeology.

A fundamental issue arising from this understanding is the biocultural interactions that expedite human vulnerability to disease. For example, modern humans are being increasingly outmaneuvered by resistant bacterial strains and arthropod vectors. This needs to be quickly addressed since modern living (cultural behaviors) facilitates the spread and transmission of resistant pathogens due to novel environments such as global travels. Another biocultural interactions leading to morphological dysfunction are human made environmental contaminants, which may potentially reduce male reproductive health with consequential declining fertility [37–40]. A third major problem of biocultural interaction and morphological transition based on individual genetic endowments is the current pandemic of overweight and obesity in many countries. Several thinkers in EM have referred to this pandemic as a classical “mismatch” or “discordance” between biological evolution and cultural change [41–43].

A general practitioner may not directly heal a patient using only evolutionary medicine principles, but without a little knowledge of the evolutionary dynamics of the human body he/she certainly will not be able to provide the best, individualized diagnosis, medico-social advice, and prescribe optimal personal treatment [44].

Conclusion

At this time, researchers and teachers in EM need to encourage medical and health science professionals to explore the evolutionary principles that inform human health and disease. The approach should be multifactorial, using latest research in EM, as well as wider media exposure, in order to inform the scientific community and the general public. Antolin et al. [40] endorse a “big picture” approach to teaching EM via the inclusion of reference frameworks for improving

information transfer and student retention. Moreover, students may become more interested in evolutionary concepts by embedding them in sociocultural behaviors. Current public interest in future human evolution is a growing area of EM by which it can engender ideas for medical and public health interventions. The expansion of EM in research and pedagogical areas is crucial due to ongoing human microevolution, which may present unknown challenges to future humans.

Detailed Curricula

The Adelaide course was run for the third time in late 2014, the Zurich courses for medical and science students are run for the fifth and third time, respectively, by spring 2016. To meet the high demand, they will be offered twice a year starting from 2015. Curricula are evolving in response to teachers and students suggestions. Full curricula and detailed course descriptions are available from the authors upon request.

Authors' Contribution Frank Rühli, MD, PhD, is a Professor of Anatomy and the founder and director of the Institute of Evolutionary Medicine at the University of Zurich. He has wide anatomy teaching experience both in Europe and Australia.

Martin Haeusler, PhD, MD, is head of the morphology group at the Institute of Evolutionary Medicine and senior lecturer at the Institute of Anatomy, University of Zurich. He has 12 years experience in teaching.

Arthur Saniotis, PhD is a Research Fellow at the School of Medical Sciences at the University of Adelaide. He has 18 years experience teaching at several universities in Australia and in Asia.

Maciej Henneberg, PhD, DSc, is a Wood Jones Professor of Anatomy at the University of Adelaide. He is also an International Fellow of the UBVO at Oxford University. For the last 41 years he has taught at universities in the USA, UK, South Africa, and Poland.
